

Assignment - 3

1. Write a function 'insert-any()' for inserting a node at any given position of the linked list. Assume position starts at 0.

```
typedef struct node
```

```
{
```

```
    int data;
```

```
    struct node *link;
```

```
};
```

```
void insert-any();
```

```
void display();
```

```
void main()
```

```
{
```

```
    int choice;
```

```
    int cont = 1;
```

```
    header = (struct node *) malloc (sizeof (node));
```

```
    clrscr();
```

```
    header->data = NULL;
```

```
    header->link = NULL;
```

```
    while (cont == 1)
```

```
    {
```

```
        printf("\n Insert at any position \n");
```

```
        printf("\n 2. Display linked list \n");
```

```
        printf("\n Enter your choice:");
```

```
        scanf("%d", &choice);
```

```
        switch (choice) {
```

```
            case 1: insert-any();
```

```
                break;
```

```
            case 2: display();
```

```
                break;
```

```
        }
```

```
printf("\n\n Do you want to continue 2 (1/0) : ");
```

```
scanf("%d", &cont);
```

```
    }  
    getch();
```

```
void insert-any()  
{
```

```
    int data-value, key;
```

```
    printf("\n Enter data of the node : ");
```

```
    scanf("%d", &data-value);
```

```
    pf("\n Enter data of the node after which new node is to  
        be inserted : ");
```

```
    sf("%d", &key);
```

```
    temp = (struct node *) malloc (sizeof (node));
```

```
    ptr = header;
```

```
    while (ptr -> link != NULL && ptr -> data != key)
```

```
    {  
        ptr = ptr -> link;
```

```
    }  
    if (ptr -> data == key)
```

```
    {  
        temp -> data = data-value;
```

```
        temp -> link = ptr -> link;
```

```
        ptr -> link = temp;
```

```
    }  
    else
```

```
    {  
        pf("\n value %d not found\n", key);
```

```
    }  
void display()
```

```
{  
    pf("\n contents of the linked list are : \n");
```

```
    ptr = header;
```

```
    while (ptr -> link != NULL)
```

```
    {  
        ptr = ptr -> link;
```

```
        pf("%d", ptr -> data);
```

2. Write a function "delete-beg()" for deleting a node from the beginning of the linked list. ⑥

```
typedef struct node
```

```
{  
    int data;  
    struct node *link;  
};
```

```
nodeptr;  
void delete-beg();
```

```
void main();
```

```
{
```

```
    int choice;
```

```
    header = (node *) malloc (sizeof (node));
```

```
    clrscr();
```

```
    header->data = NULL;
```

```
    header->link = NULL;
```

```
    if (header->link == NULL)
```

```
    {
```

```
        pf("\n Empty linked list. Deletion not possible
```

```
    }  
    else
```

```
    {  
        ptr = header->link;
```

```
        header->link = ptr->link;
```

```
        free(ptr);
```

```
        pf("\n Node deleted from beg\n");
```

```
    }  
    void display();
```

```
    {  
        pf("\n linked list is :\n");
```

```
        ptr = header;
```

```
        while (ptr->link != NULL)
```

```
        {  
            ptr = ptr->link;
```

```
            pf("%d", ptr->data);
```

3. Write a function "delete_end()" for deleting a node from the end of the linked list. (7)

```
typedef struct node
```

```
{
    int data;
    struct node * link;
};
```

```
node * ptr, * ptr1;
```

```
void delete_end();
```

```
void main()
```

```
{
```

```
    head = (node *) (malloc(sizeof(node)));
```

```
    head->data = NULL;
```

```
    head->link = NULL;
```

```
    if (head->link == NULL)
```

```
    {
```

```
        printf("\n Empty linked list. Deletion not possible.\n");
```

```
    } else
```

```
    {
```

```
        ptr = head;
```

```
        while (ptr->link != NULL)
```

```
        {
```

```
            ptr1 = ptr;
```

```
            ptr = ptr->link;
```

```
        }
```

```
        ptr1->link = ptr->link;
```

```
        free(ptr);
```

```
        printf("\n Node deleted from the end.\n");
```

```
    }
```

```
}
```
